Abstrak

Kanker mulut atau kanker rongga mulut adalah kanker yang menyerang jaringan epitel mukosa rongga mulut. Kanker merupakan penyakit dengan angka kematian yang tinggi. Oleh karena itu, sangat penting untuk dapat memberikan bantuan pengetahuan kepada masyarakat yang masih cukup rendah pengetahuannya tentang kanker khususnya kanker mulut. Salah satu cara untuk membantu mendiagnosis penyakit adalah dengan menggunakan sistem pakar. Pada penelitian ini dikembangkan aplikasi sistem pakar untuk mendiagnosis kanker mulut berdasarkan gejala dan menghasilkan solusi diagnosis dan pengobatan. Sistem pakar yang dikembangkan menggunakan algoritma certainty factor (CF). Di mana mampu mengatasi ketidakpastian dengan memberikan nilai tingkat kepercayaan dari para ahli dan pengguna. Dari hasil pengujian akurasi menunjukkan nilai sebesar 87%, sehingga sistem dapat berfungsi dengan baik.

Kata kunci: certainty factor, sistem pakar, kanker mulut

Abstract

Oral cancer or oral cavity cancer is cancer that attacks the epithelial tissue of the oral mucosa. Cancer is a disease with a high mortality rate. So, it is very important to be able to provide information to the public about oral cancer. One way to help diagnose disease is to use an expert system. In this study, an expert system application was developed to diagnose oral cancer based on symptoms and produce a diagnosis and treatment solution. The expert system developed using the certainty factor algorithm (CF). Where is able to overcome uncertainty by providing a value level of trust from experts and users. From the results of the accuracy test, it shows a value of 87%, so the system can function properly.

Keywords: certainty factor, expert system, oral cancer

INTRODUCTION

One of the important functions for the human body in maintaining its life is the function of metabolism. Metabolic function is obtained from energy through the digestive process. Providing information and knowledge about the digestive system is important, this is because the digestive system plays a very important role in producing

nutritious food that can support the performance of human activities (Napianto, Rahmanto, Borman, Lestari, & Nugroho, 2018). This process involves several organs in the human body, one of which is the mouth or oral cavity. Abnormalities or problems that occur in the mouth will be fatal, including the lack of nutrients that enter the body. One of the dangerous diseases that can attack the mouth is oral cancer or oral cavity cancer (Napianto

et al., 2018). Oral cancer or also known as oral cavity cancer is a cancer that attacks the mucosal epithelial tissue in the oral cavity (including the lips, gums, floor of the mouth, tongue, cheeks and palate). Cancer is a disease with a high mortality rate. WHO noted, in 2018 there were 18.1 million new cases of cancer with a mortality rate of 9.8 million (Irmawati, 2020). The number of cancer patients in Indonesia is quite large, but the number of cancer specialists in Indonesia is still very minimal (Nikita, Sadawarti, & Kaur, 2020). Moreover, public knowledge about cancer, especially oral cancer is still low. Therefore, it is very important to be able to provide knowledge assistance to Indonesian people who still lack knowledge about cancer. For that we need a system that can provide knowledge and diagnose oral cancer.

Today the field of Artificial intelligence has penetrated in everyday life and is used to facilitate human activities. Artificial intelligence examines how to build systems that have the ability to complete work like humans in solving problems (Borman, Napianto, Nurlandari, & Abidin, 2020). Expert system is one part of the field of artificial intelligence. An expert system is a computer system that adopts the knowledge of people who are experts in certain fields in solving problems that are usually solved by experts (Fahmi et al., 2020). In an expert system, knowledge, facts, and ways of thinking are needed to solve problems that are usually solved by an expert. However, an expert usually gets uncertain answers and statements from patients, such as: probably, most likely, or almost certainly (Agustina, Pratomo, Wibawa, & Rahayu, 2017). To build an expert system with uncertain input statements, it is possible to use the certainty factor (CF) approach. CF is an algorithm that can explain the level of certainty of size based on facts so that it can provide an overview of the level of confidence (Desnelita et al., 2018). CF has the advantage that it can provide calculation results based on the level of confidence of the symptoms experienced by the user, so that it can produce answers to cases of uncertainty that produce better truth (Fahmi et al., 2020). CF can be applied in expert systems to build rule-based applications, to generate analysis of information about a particular problem and to generate mathematical analysis in solving problems. CF can be applied to assist in the identification and diagnosis of disease.

Several previous studies have shown that CF is able to provide good results and accuracy. The first research, regarding the development of an expert system for diagnosing dental and oral diseases using the CF method (Pasaribu, Sihombing, & Suherman, 2020). This research produces an

expert system that has an accuracy rate of 99%, which is obtained from a comparison of diagnoses between the results of an expert and an expert system. The research is about the application of the CF method to diagnose rheumatic diseases (Hairani, Abdillah, & Innuddin, 2019). In this study, CF was able to produce an accuracy of 80%, which means the expert system built has good performance. In addition, this study explains that CF can overcome uncertainty or incomplete information provided by users. Furthermore, research on the digestive tract disease system in expert children uses the CF method (Astuti, Sutarno, & Rasim, 2017). Testing is done by comparing the results of system diagnostics with expert diagnoses. The results showed that this system has 100% accuracy with a confidence value of 80.5%.

This study aims to build an expert system to diagnose oral cancer and how to solve and prevent it. This study applies the CF algorithm to overcome uncertainty in the development of an expert system so that it can help and provide knowledge to the public in diagnosing oral cancer based on the symptoms felt or experienced. The expert system will be developed based on a website so that it can be used easily, anywhere and anytime.

RESEARCH METHODS

To carry out research, there are several stages carried out. In the expert system research, the diagnosis of oral cancer consists of the following stages:

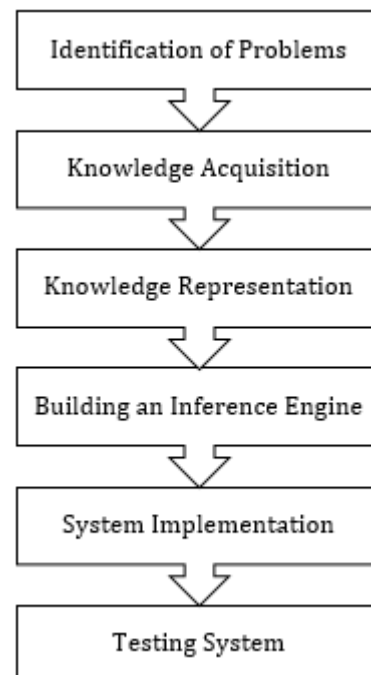

Figure 1. Research Stages

Identification of Problems

In building an expert system in diagnosing oral cancer, it begins with problem identification. Problem identification has the aim of knowing the main problem and determining the need to provide solutions to these problems (Rahmanto, Alfian, & Borman, 2021).

Oral cancer or oral cavity cancer is a head and neck cancer with the highest mortality rate compared to all types of malignancies. However, many people are not aware of this disease. Lack of knowledge from the community can cause the number of people with oral cancer to increase. For that we need a system that can diagnose and provide knowledge and provide solutions for oral cancer.

Knowledge Aquisition

To build an expert system requires a collection of knowledge obtained from experts. So, a knowledge acquisition process is needed. Knowledge acquisition is a process of exploring, organizing and organizing knowledge from knowledge sources that are used as knowledge bases in expert systems (Borman et al., 2020). Knowledge acquisition through the stages of extracting information from experts including problem solving in certain cases (Sucipto, Fernando, Borman, & Mahmuda, 2019). This stage involves the process of obtaining knowledge from sources of knowledge obtained from experts, books, documents, or other sources of knowledge (Konstantinopoulou, Kovas, Hatzilygeroudis, & Prentzas, 2019).

In this study, to obtain data or information about oral cancer such as symptoms, diseases, solutions and the value of trust for each symptom, observations and interviews were carried out. The data collected came from the results of consultations with Surgical Oncology Experts at the Regional Hospital Dr. Hi Abdul Moeloek, Lampung Province. From the results of observations and interviews with experts, it was found that there are five oral cancers that are often suffered by the community. In addition to symptom and disease data, data on the weight or level of confidence obtained from experts is also needed. The weight data is based on the guidelines from the terms table (interpretation). Table 1 below is a table of terms (interpretation) which is used as a reference in giving the weight of the level of confidence.

Table 1. Terms (Interception)

No.	Interpretation	Weight
1	Definitely not	-1.0

No.	Interpretation	Weight
2	Almost certainly not	-0.8
3	Most likely not	-0.6
4	Probably not	-0.4
5	Don't know/not sure	-0.2 --- 0.2
6	Possible	0.4
7	Most likely	0.6
8	Almost sure	0.8
9	Certainly	1.0

The data on symptoms, diseases and the level of confidence (weight) from the experts are presented in the following Table 2.

Table 2. Symptoms, Disease and Weight Data

No.	Symptoms	Weight	Disease
1	Lip color doesn't look pink	0.6	Lip Cancer
2	Lips look dry and easily irritated	0.8	
3	Pain in the area around the lips	0.6	
4	Sores in the mouth that are difficult to heal	0.8	
5	Bleeding on the lips	0.6	
6	Often experience numbness in the oral cavity	0.6	
7	Sores in the mouth that are difficult to heal	0.8	Tongue Cancer
8	Often experience numbness in the oral cavity	0.4	
9	Pain in the area around the tongue	0.8	
10	There is a lump on the tongue	0.8	
11	Red or white patches on the tongue	0.6	Gum Cancer
12	Often experience numbness in the oral cavity	1.0	
13	Inflammation of the gums	0.8	
14	Pain in the Gum Area	0.8	
15	Difficulty chewing and swallowing food	0.6	

No.	Symptoms	Weight	Disease
16	It's hard to talk	0.8	Oral Base Cancer
14	Sores in the mouth that are difficult to heal	0.8	
15	Often experience numbness in the oral cavity	0.4	
16	The presence of a lump on the mucous membrane found at the bottom of the floor of the mouth	0.8	
17	Thickening of the tissue lining the surface of the oral cavity	0.8	
18	Presence of lumps in the mouth	0.8	Jaw Cancer
19	Often experience numbness in the oral cavity	0.8	
20	Abnormal tooth growth	0.6	
21	loose teeth	0.8	
22	Swelling of the jaw	0.8	
23	Swollen lymph nodes in the neck	0.6	

Knowledge Representation

After the knowledge acquisition stage, the next step is knowledge representation. This stage is the stage of regularly organizing the knowledge that has been obtained to encode expert knowledge into the appropriate media form. This stage has an important role in the development of an expert system, this is because a good solution will depend on a good representation as well (Yu, Wu, & Zhang, 2017). If the knowledge representation is not made properly then the impact will affect the next stage and the resulting system is not as desired (Muhammad, Garba, Oye, & Wajiga, 2018). At this stage, symptoms, diseases and solutions are entered into the decision table and rules are made according to the knowledge that has been obtained from an expert which will later be used to make it easier to build an inference engine.

Building an Inference Engine

Certainty Factor (CF) is one of the techniques used to overcome uncertainty in decision making. The CF method is an approach that can be used to confirm a fact that is certain or uncertain (Fahrozi, Harahap, Syahputra, & Pane,

2019). Certainty Factor (CF) can occur under various conditions. Among the conditions that occur is that there are several antecedents (in different rules) with the same consequence. To calculate CF can use the following equation:

$$CF[h,e] = MB[h,e] - MD[h,e] \dots\dots\dots (1)$$

Where, h is a measure of confidence, and e is the percentage of confidence. For CF involving one premise, you can use the following equation:

$$CF[h,e] = CF_{[user]} * CF_{[expert]} \dots\dots\dots (2)$$

As for CF with similar conclusions, you can use the following formula:

$$CF_{combined} = CF_1 + CF_2 * (1 - CF_1) \dots\dots\dots (3)$$

Where CF_1 and CF_2 have the same hypothesis. CF_1 is the value of the certainty factor of evidence 1 on the hypothesis, while CF_2 is the value of the certainty factor of evidence 2 on the hypothesis. Then the result of the first $CF_{combined}$ will be CF_{fold} .

System Implementation

Implementation is the stage where the system will be built through coding with a programming language (Herdiansah, Borman, & Maylinda, 2021). The purpose of this stage is to create a user interface so that users can easily use the application. The application of an expert system for diagnosing oral cancer was developed based on a website with coding using the PHP programming language with Sublime Text text editor tools, while the database uses MySQL.

Testing System

The next stage is to test the system. This stage aims to determine the performance of the application that was built (Borman et al., 2018). This stage also serves to ensure that the system can run well, free from errors and has optimal performance (Kurniawan, Iqbal, Friadi, Borman, & Rinaldi, 2019). In this study, the test that will be carried out is with accuracy. Accuracy is obtained from the comparison of diagnostic results obtained by the expert system with answers from experts. For the accuracy value, use the following equation:

$$Accuracy = \frac{\text{Number of correct predictions}}{\text{Total number of predictions}} \times 100\% \quad (3)$$

Where, the number of correct predictions is obtained from the number of diagnostic records by the system whose results are the same as diagnoses by an expert.

While the total number of predictions is the total number of diagnosed cases.

RESULTS AND DISCUSSION

The inference engine is the part that provides the mechanism for thinking functions and system reasoning patterns used by an expert. In building an expert system for diagnosing oral cancer using the Certainty Factor (CF) approach. CF solves the problem of uncertainty by justifying certain or uncertain facts. In the expert system developed, the user will make a diagnosis by presenting symptom questions then ending with a conclusion in the form of a diagnosis and solution. In the system developed, experts and users will be given a choice of the level of trust according to what is experienced and what has been determined. After selecting the confidence level, it will be processed with CF. The process of calculating CF starts from belief with rules based on facts or symptoms based on rules. The following is a case study in the application of CF.

IF Lip color doesn't look pink
AND Lips look dry and easily irritated
AND Pain in the area around the lip
AND Bleeding on the lips
THEN Lip Cancer

In calculating CF, it starts from determining the weight value for each symptom. For each weight and symptom obtained from the results of the acquisition of knowledge contained in table II. The following is the weight of the disease that has been determined by an expert.

$CF_{\text{expert [symptoms 1]}} = 0.6$
 $CF_{\text{expert [symptoms 2]}} = 0.8$
 $CF_{\text{expert [symptoms 3]}} = 0.6$
 $CF_{\text{expert [symptoms 4]}} = 0.6$

Furthermore, the user who will diagnose determines the level of confidence in the symptoms that are adjusted to the conditions experienced. For this, the level of user confidence is as follows:

Symptom 1 = 0.8 (Almost Certain)
Symptom 2 = 1.0 (Certain)
Symptom 3 = 0.6 (most likely)
Symptom 4 = 0.4 (Maybe)

Then next, the level of trust of experts and users is adjusted according to predetermined rules

Rule 1

IF Lip color doesn't look pink THEN Lip Cancer

Rule 2

IF Lips look dry and easily irritated THEN Lip Cancer

Rule 3

IF Pain in the area around the lip THEN Lip Cancer

Rule 4

IF Bleeding on the lips THEN vibrio Lip Cancer

Rule 1 calculation process:

$$\begin{aligned} CF_{\text{symptoms 1}} &= CF_{\text{[user]}} * CF_{\text{[expert]}} \\ &= 0.8 * 0.6 \\ &= 0.48 \end{aligned}$$

Rule 2 calculation process:

$$\begin{aligned} CF_{\text{symptoms 2}} &= CF_{\text{[user]}} * CF_{\text{[expert]}} \\ &= 1.0 * 0.8 \\ &= 0.8 \end{aligned}$$

Rule 3 calculation process:

$$\begin{aligned} CF_{\text{symptoms 3}} &= CF_{\text{[user]}} * CF_{\text{[expert]}} \\ &= 0.6 * 0.6 \\ &= 0.36 \end{aligned}$$

Rule 4 calculation process:

$$\begin{aligned} CF_{\text{symptoms 4}} &= CF_{\text{[user]}} * CF_{\text{[expert]}} \\ &= 0.4 * 0.6 \\ &= 0.24 \end{aligned}$$

In this case study, it consists of several symptoms, so getting the CF value uses the following calculations:

$$\begin{aligned} CF_{\text{combine 1}} (CF_{\text{symptoms 1}}, CF_{\text{symptoms 2}}) \\ &= CF_{\text{symptoms 1}} + CF_{\text{symptoms 2}} * (1 - CF_{\text{symptoms 1}}) \\ &= 0.48 + 0.8 * (1 - 0.48) = 0.896 (CF_{\text{old 1}}) \end{aligned}$$

$$\begin{aligned} CF_{\text{combine 2}} (CF_{\text{old 1}}, CF_{\text{symptoms 3}}) \\ &= CF_{\text{old 1}} + CF_{\text{symptoms 3}} * (1 - CF_{\text{old 1}}) \\ &= 0.896 + 0.36 * (1 - 0.896) = 0.933 (CF_{\text{old 2}}) \end{aligned}$$

$$\begin{aligned} CF_{\text{combine 3}} (CF_{\text{old 2}}, CF_{\text{symptoms 4}}) \\ &= CF_{\text{old 2}} + CF_{\text{symptoms 4}} * (1 - CF_{\text{old 2}}) \\ &= 0.933 + 0.24 * (1 - 0.933) = 0.949 (CF_{\text{old 3}}) \end{aligned}$$

The final CF_{fold} is the result of disease CF. Based on the results of these calculations, the last CF_{old} result is 0.949 or 94.9%. So based on the case study, the diagnosis is Lip Cancer.

Next is the implementation in the form of an expert system that can be used by users. Expert system development is done by making a program using a certain programming language to later become an application. The expert system application for diagnosing oral cancer was developed based on a website using the PHP programming language with Sublime Text text editor tools and MySQL database. The application of an expert system for diagnosing oral cancer that has been developed has two users, namely: user and admin (as website manager). To make it easy to access, users who will diagnose oral cancer do not need to log in and can directly use the system. The

main menu GUI display of the developed expert system application can be seen in Figure 2 below.

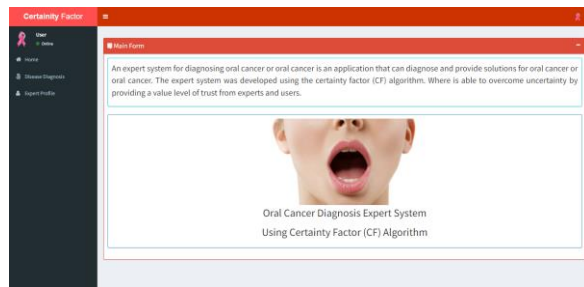

Figure 2. Main Menu Display of Expert System Applications

System users who will diagnose can choose the symptoms experienced and enter the user's level of trust according to what is felt. Then the system converts it into a value (weight) of the degree of confidence. Figure 3 below is a GUI display from the disease diagnosis page.

Figure 3. Disease Diagnosis Display

After the user selects the symptoms experienced, the system will display the results of the diagnosis. The display of the diagnosis results can be seen in Figure 4. From the display the system will display the disease and solutions based on each symptom and level of confidence in the questions that have been previously inputted by the user. The admin as the website manager can manage symptoms, diseases, expert rules and the weight of the level of trust as well as disease handling solutions.

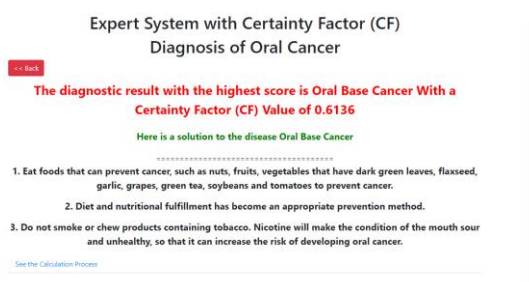

Figure 4. Display of Diagnostic Results

After the expert system is built, the next step is to conduct testing. This is done to ensure that the system can run as it should and the CF algorithm has a good performance in diagnosing. System testing is done by testing the accuracy. The accuracy test is carried out by matching the expert's analysis diagnosis with what is generated by the system. The test was carried out using a random sample of 30 cases to the user system and an expert. Then, the results will be compared and the number of correct diagnoses made by the expert system will be calculated. Calculation of accuracy using equation (3) which has been discussed previously. Figure 5 The following is a chart of the results of the accuracy tests carried out.

Figure 5. Chart of Accuracy Test Results

Of the 30 cases that have been tested, the expert system is able to answer validly as many as 27 cases or 87%. While the error rate is 13%. This is because there are several symptoms that are similar and shared by several diseases. This is what causes the emergence of almost the same value results, so there are different results from the diagnostic results by experts. The results of the accuracy are then converted and included in the accuracy level guidelines with the categories: Good, with a value of 76%-100%; Enough, with a value of 56%-75%; Less Good, with a value of 40%-55%, while Less Good, has a value of less than 40% (Borman & Purwanto, 2019). If it is included in that category, then the accuracy of the developed system is in the good category. This shows that the expert system for diagnosing oral cancer by applying the CF method can work well.

CONCLUSIONS AND SUGGESTIONS

Conclusion

In this paper, an expert system for diagnosing oral cancer is developed which can diagnose based on the symptoms selected by the user and then generate the disease and solutions. The expert system developed applies the Certainty Factor (CF) method. Where CF is able to overcome uncertainty by providing a value for the level of

trust from experts and users. The results of the tests carried out show that the accuracy of the expert system developed is 87%, so the system can function properly.

Suggestion

To improve further research, there are several things that can be developed, including: (1) comparing the algorithms of other expert systems, so as to get the algorithm with the best performance; (2) can add deep learning algorithms to get good accuracy results; (3) develop not only oral cancer but other diseases related to the mouth and oral cavity.
